

The Meta Tracking Audit Workbook

Find and fix the Pixel + CAPI defects inflating your cost-per-result — with evidence you can verify in your own Events Manager. For stores running Meta ads. ~90 minutes start to finish.

How to use: work top to bottom. Every check has a **Pass / Fail / N-A** cell and an evidence cell — fill them in. At the end you'll have a prioritized fix list and a before-state record so you can prove improvement after fixes. Nothing here requires code access to start; items marked  need your developer or app settings to fix.

Part 1 — Inventory & deduplication (the double-counting check)

1.1 Event inventory.

Events Manager → Data sources → your Pixel → Overview. For each business-critical event (Purchase, Lead, InitiateCheckout, AddToCart), record how it arrives.

Event	Browser	Server	Both?	Notes
Purchase				
Lead				
InitiateCheckout				
AddToCart				

1.2 Dedup verification.

Open each "Both" event → look for deduplication stats. Meta dedupes only on matching `event_name` + `event_id`. If dedup shows 0% or is absent while both channels fire, you are double-counting — every reported Purchase may be two.  Fix: one `event_id` generated per user action, passed to BOTH the Pixel call and the CAPI payload. *Classic failure: platform-native Pixel (e.g. Shopify) + a separate CAPI app, each inventing its own ids.*

1.3 Timing.

Server events must land within the dedup window (48h; in practice, minutes). Nightly batch CAPI uploads of events the Pixel already sent = double-count. Record your server-event latency: _____

1.4 Seven-day reconciliation.

Pick the last full 7 days.

	Meta reported	Backend actual	Δ %
Purchases			
Revenue			

Read: within $\pm 5\text{--}15\%$ = normal attribution modeling. Meta 30%+ HIGH = double-counting (go to 1.2). Meta far LOW = events not firing or rejected (Part 3).

Part 2 — Event Match Quality (the performance check)

2.1 Score every server event.

Events Manager shows EMQ (1–10) per server event. Under 6 = you're paying for worse optimization than you could have. Target 8+ on Purchase/Lead.

Event	EMQ now	em	ph	external_id	fbp	fbc	IP+U
Purchase							
Lead							

2.2 The parameters that move EMQ

(mark ✓ present / ✗ absent above): email `em` and phone `ph` as SHA-256 of

normalized

values (lowercase, trimmed; phone as digits/E.164) — hashing `" Name@Gmail.com"` vs `"name@gmail.com"` silently kills matching; `external_id` (hashed customer id); `fbp` cookie forwarded server-side; `fbc` whenever a click id exists — missing `fbc` on paid-click conversions is the most common attribution leak; client IP + user agent on website events. 🛠 Every ✗ on Purchase is a fix-list line.

2.3 action_source truthfulness.

Server events must carry the real source (`website` , `physical_store` ...). Wrong values risk rejection and skew attribution. Record what yours send: _____

Part 3 — Delivery health

3.1 Diagnostics tab.

Events Manager → Diagnostics. List every active issue below; rejected/filtered events never reach optimization.

Issue	Affected event	Severity	Owner

3.2 Live test.

Events Manager → Test events; put the `test_event_code` on server payloads. Trigger one real test conversion. Watch: browser row arrives ☐ server row arrives ☐ they deduplicate ☐.

3.3 Consent path.

Repeat 3.2 as a consent-declined EU visitor. Does your setup behave as intended (and legally) on both channels? Consent tools silently killing one channel breaks the dedup assumptions from Part 1. Result: _____

3.4 Domain.

Business Manager → domain verified ☐ web events configured ☐.

Part 4 — Fix priority matrix

Transfer every ✖ and Fail. Order by (revenue impact × ease). Do the top three first, then re-run Parts 1.4 and 2.1 after 7 days and record the after-state next to your before-state — that delta is your proof it worked.

#	Defect	Impact (H/M/L)	Ease (H/M/L)	Owner	Done
1					
2					
3					
4					
5					

Maintenance:

re-run 1.2, 2.1, 1.4, and 3.1 after every theme change, app install, or checkout migration, and monthly regardless — tracking breaks silently.

Stuck, or want this done for you with before/after evidence? Fixed-price diagnostic and implementation:
