Applied AI Engineer — measurement, agents, systems

5+ years building. Independent/contract engineer focused on shipping small, reliable tools: conversion measurement pipelines, agent workflows, and Python/JavaScript systems that run in production.

What I ship

- Meta Pixel + Conversions API diagnostics: event_id deduplication, Event Match Quality, browser-vs-server event count gaps.
- Small Python/JS tools and agent workflows that are actually runnable, not slideware.
- Open source: <https://github.com/Beexly/autonomous-revenue-engine> — includes a "conformal-lite" calibration/uncertainty helper, CAPI diagnostics, and single-file HTML tools.
- Live tools: <https://raw.githubusercontent.com/Beexly/autonomous-revenue-engine/main/docs/index.html>

Skills

Python (advanced): scripts, APIs, data and measurement tooling, agent workflows.
JavaScript/TypeScript (intermediate-advanced): browser tracking, Node scripts, small React front-ends.
HTML/CSS (intermediate). SQL (intermediate). Flask/FastAPI (intermediate). AWS: basic/familiar, not expert. Shopify and web analytics/tracking implementation. AI tooling: Cursor and similar coding agents daily; LLM APIs inside shipped tools.

Engineering practice

I write tests for the parts that can break money or data, rather than chasing coverage numbers. Debugging with Chrome DevTools and pdb/structured logging. I read every AI-generated diff before it lands.

Availability & Rate

Contract from \$75/hr, or \$250 diagnostic / \$500–\$1,500 implementation. Remote, US-based (Kingwood/Houston, TX). Can start this week.
